

A GREEN FRUITED RUBUS FROM BRAZIL.

This species, *Rubus brasiliensis* Mart., occurs in the Highlands of Minas Geraes, where it was collected in 1914 by the Dorsett, Shamel and Popenoe Expedition. The plant grows to a height of six or more feet, and produces its fruits in clusters of good size. It is called by the natives, amora, a name which properly belongs to the mulberry but is also applied to *Rubus rosaefolius* as well as the species here shown. The fruits are translucent yellowish-green when ripe, sweet and agreeable in flavor but rather seedy. For breeders of rubiaceous fruits this species may be of interest and value. Brazilian Expedition Photo No. D 1579, taken at Sitio, Brazil, Jan. 28, 1914.
